

# QAPP Amendment Form

---

**PROGRAM:** Delta Regional Monitoring Program (Delta RMP)  
**PROJECT:** Current-Use Pesticide (CUP)  
**PREVIOUS QAPP VERSION:** Version 1.4  
**AMENDED QAPP VERSION:** Version 1.5  
**PREPARED BY:** MLJ Environmental  
**DATE SUBMITTED:** Submitted on February 9, 2024

---

**Title: Amendment to add high-conductivity toxicity testing procedures and update the copper MDL value.**

---

**Section of QAPP affected:**

This amendment applies to Element 14.1, **Table 14** (Field and laboratory analytical methods), and **Table 16** (Analytical QC).

**Reason for Changes:**

Element 14 has been updated to include procedures for toxicity testing in samples with high salinity concentrations. Element 14 will include a new table (**Table 17**) that identifies salinity thresholds for each prescribed traditional organism and the alternate species to test with if the upper salinity threshold is exceeded by the sample. A process flowchart for reviewing and processing toxicity reporting when a salinity control is used has been added as the new **Figure 10**. This update will also be reflected in the newest version of the Surface Water Data Management SOP v2.5 that will be submitted with this amendment.

The addition of procedures for high-conductivity controls is based on the overall objectives of the monitoring to better understand the impacts of pesticides on the aquatic ecosystem of the Delta – including separating out the impact of water quality parameters such as salinity on those impacts. The use of alternate species and high-conductivity controls for samples with elevated salinity will allow for a better understanding of whether toxicity is a result of salinity or other contaminants such as pesticides. The alternate species allow for the continued assessment of toxicity across trophic levels using species that are representative of high salinity environments in the Delta. SWAMP MQOs recommend that alternate species be tested when sample conditions are outside of the standard test organism tolerance limits; the previous version of the CUP QAPP (v1.4) does not identify those alternate species. This amendment identifies the alternate test species and other test protocols.

The four-year study design includes the collection of 196 environmental samples each year to be tested for toxicity using five species resulting in 960 toxicity test results (8 sites

per event x 6 events per year x 4 years x 5 species). It is estimated that two samples per event collected in year 4 will be above the conductivity threshold for three species (36 tests). Based on that estimation, approximately 4% of the toxicity tests performed over the four-year study would be impacted by this recommendation.

**Table 14** has been updated to reflect the most recent MDL value for reporting copper.

**Table 16** has been updated to clarify the requirements for pesticide laboratory duplicate samples when a matrix spike duplicate is not included in the batch. These requirements are being clarified to address batch completeness issues that occurred during Year 3 monitoring.

### **Detail of Changes:**

Updated tables and text are included below. Yellow-highlighted content indicates an update has been made. Strike out text indicates a deletion of content.

## 14.1 ADDITIONAL TOXICITY CONTROLS FOR CERIODAPHNIA DUBIA

Toxicity testing according to The SWAMP MQOs describes the recommendation for recommend secondary conductivity controls when an ambient sample specific conductivity is outside of the physiological range of the test organisms. These can be either high-conductivity controls (i.e., synthetic control waters salted up to match the highest conductivity of the ambient samples collected) or low-conductivity controls (i.e., synthetic control waters diluted with de-ionized water to match the lowest conductivity of the ambient samples collected). The high-conductivity controls will include additional alternate species when the sample conductivity concentration exceeds the upper tolerance threshold of the traditional test species. The latter low-conductivity controls will include nutrients (i.e., biotin, sodium selenate, vitamin B<sub>12</sub>, and thiamine hydrochloride) added to match the target concentrations in culture water. Secondary controls will be tested as outlined below.

Depending on the conductivity range observed in ambient sample waters, additional negative controls may be tested to control for water quality near the organisms' tolerance screening value.

### 14.1.1 Low-Conductivity Controls

Figure 8 and Figure 9 outline procedures for how low-conductivity controls for *C. dubia* toxicity testing should be handled. Figure 8 is a flowchart depicting what controls the lab should prepare based on the range of conductivity in ambient samples. Figure 9 is a flowchart showing to which control each ambient sample should be compared.

SWAMP guidance states that for *C. dubia* toxicity testing, the sample conductivity should be above 100 µS/cm; however, previous Delta RMP testing found that *C. dubia* reproduction in cultures may be affected by conductivity as high as 127 µS/cm. Therefore, the lab shall run a tolerance control matching the lowest sample conductivity when there are sample(s) with conductivity ≤ 130 µS/cm. The laboratory will also have discretion to run a second tolerance control when there are multiple samples with conductivity ≤ 130 µS/cm (i.e., if samples with conductivity ≤ 130 µS/cm have a difference of at least 50 µS/cm).

### 14.1.2 High-Conductivity Controls

High-conductivity controls may be run for *C. dubia*, *P. promelas*, or *S. capricornutum* tests according to the salinity thresholds outlined in Table 17 and the procedures outlined in Figure 10. When the specific conductivity of a sample exceeds the lower tolerance threshold but does not exceed the upper tolerance threshold of the test species, the test will proceed using the traditional species with the addition of a tolerance control matching the sample conductivity. In these scenarios the laboratory will use the standard control to determine if the test met test acceptability criteria (i.e., that test organisms are

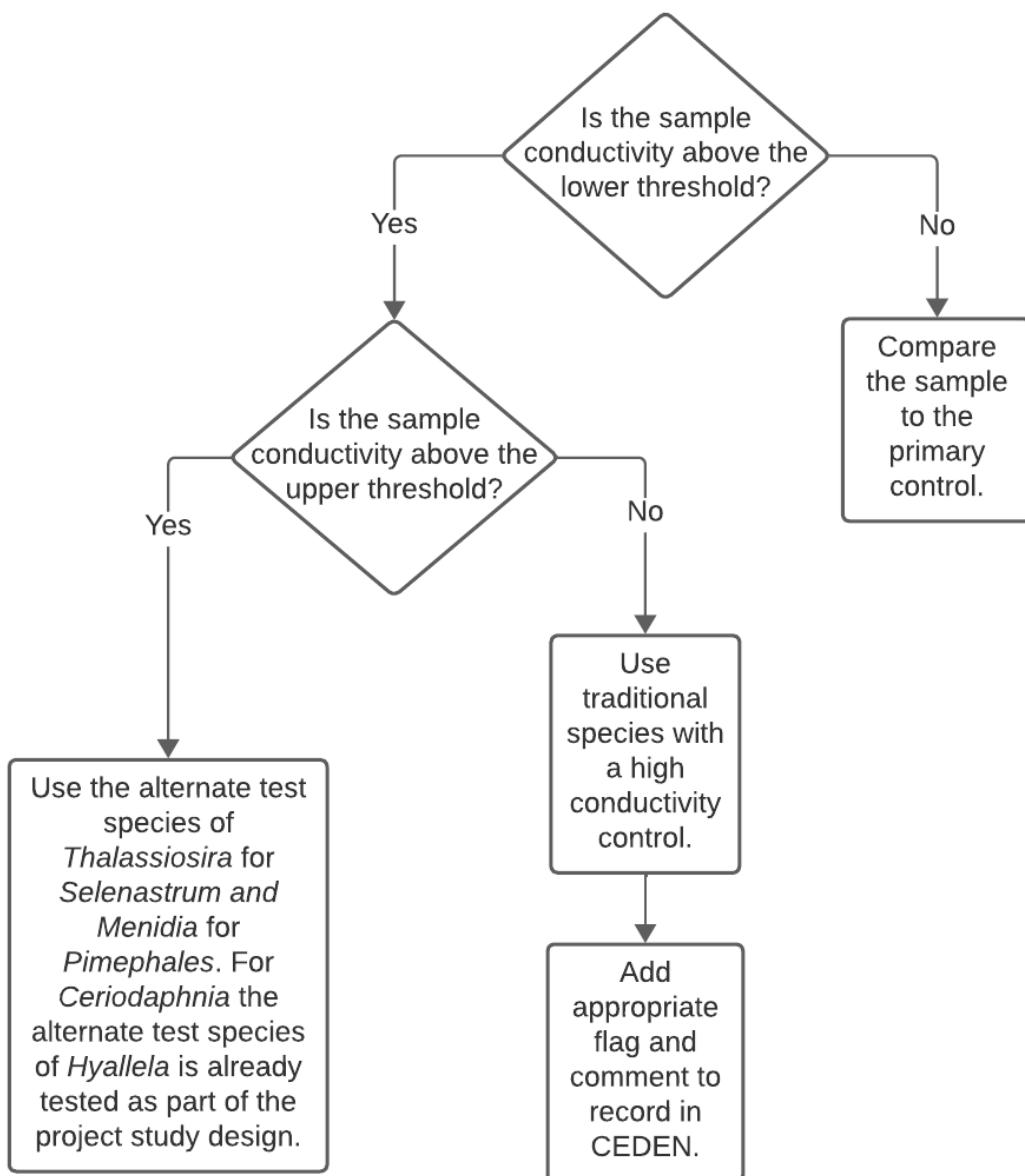

sufficiently healthy) and the high-conductivity control for statistical comparisons to the sample to determine toxic effects beyond that of salinity, and for evaluation against TIE triggers, if the tolerance control also meets acceptability criteria. Otherwise, the sample is compared with the standard laboratory control.

When the specific conductivity of a sample exceeds the upper tolerance threshold of the traditional test species, the alternate test species identified in **Table 17** will be used in lieu of the traditional species. For *C. dubia* samples above the upper threshold, this will result in the elimination of the test because the alternate species, *H. azteca*, is already included in Delta RMP CUP toxicity testing.

**Table 17. Conductivity thresholds for toxicity test organisms.**

TRADITIONAL SPECIES	LOWER THRESHOLD ( $\mu\text{S}/\text{CM}$ ); ADD HIGH CONDUCTIVITY CONTROL	UPPER THRESHOLD ( $\mu\text{S}/\text{CM}$ ); USE ALTERNATE TEST SPECIES	ALTERNATE SPECIES
<i>Selenastrum capricornutum</i>	1,500	3,000	<i>Thalassiosira</i>
<i>Ceriodaphnia dubia</i>	1,900	2,500	<i>Hyalella azteca</i>
<i>Pimephales promelas</i>	1,900	6,000	<i>Menidia beryllina</i>

**Figure 10. Flowchart illustrating procedure for selecting the appropriate high-conductivity controls for toxicity testing.**

**Table 16. Analytical QC**

Sample Type	Frequency	Acceptable Limits	Corrective Action	Analytical SOP
<b>Ancillary Parameters by EPA 160.2 – TSS</b>				
Laboratory Blank	1 per 20 samples, minimum 1 per batch	< MDL	Determine cause of problem, remove sources of contamination, reanalyze suspect samples or flag all suspect data.	--
Laboratory Duplicate	1 per 20 samples, minimum 1 per batch	RPD<25% (n/a if native concentration of either sample<RL)	Visually inspect the samples to determine if a high RPD could be attributed to sample heterogeneity. Reanalyze suspect samples or qualify the results and document the heterogeneity.	--
<b>Ancillary Parameters</b>				
Laboratory Blanks	1 per 20 samples, minimum 1 per batch	< MDL	Determine cause of problem, remove sources of contamination, reanalyze suspect samples or flag all suspect data.	Appendix III - Organic Carbon by SM 5310 B, TKN by EPA 351.2, Cations by EPA 200.7
Laboratory Control Spike	1 per 20 samples, minimum 1 per batch	80-120%	Determine cause, take appropriate corrective action. Recalibrate and reanalyze all suspect samples or flag all suspect data.	
Matrix Spike	1 per 20 samples, minimum 1 per batch	80-120%	Determine cause, take appropriate corrective action. Recalibrate and reanalyze all suspect samples or flag all suspect data.	
Matrix Spike Duplicate	1 per 20 samples, minimum 1 per batch	RPD ≤ 25	Determine cause, take appropriate corrective action. Recalibrate and reanalyze all suspect samples or flag all suspect data.	

Sample Type	Frequency	Acceptable Limits	Corrective Action	Analytical SOP
<b>Trace Metals</b>				
Laboratory Blanks	1 per 20 samples, minimum 1 per batch	< MDL	Determine cause of problem, remove sources of contamination, reanalyze suspect samples or flag all suspect data.	Appendix III – Trace Elements by EPA 200.8
Laboratory Control Spike	1 per 20 samples, minimum 1 per batch	75-125%	Determine cause, take appropriate corrective action. Recalibrate and reanalyze all suspect samples or flag all suspect data.	
Matrix Spike	1 per 20 samples, minimum 1 per batch	75-125%	Determine cause, take appropriate corrective action. Recalibrate and reanalyze all suspect samples or flag all suspect data.	
Matrix Spike Duplicate	1 per 20 samples, minimum 1 per batch	RPD ≤ 25	Determine cause, take appropriate corrective action. Recalibrate and reanalyze all suspect samples or flag all suspect data.	
<b>Pesticides</b>				
Laboratory Blanks	1 per 20 samples, minimum 1 per batch	< MDL	Determine cause of problem, remove sources of contamination, reanalyze suspect samples or flag all suspect data.	Appendix III – SOP - OCRL-WATER-PEST_06
Laboratory Control Spike	1 per 20 samples, minimum 1 per batch	70-130%	Determine cause, take appropriate corrective action. Recalibrate and reanalyze all suspect samples or flag all suspect data.	
Matrix Spike	1 per 20 samples	70-130%	Determine cause, take appropriate corrective action. Recalibrate and reanalyze all suspect samples or flag all suspect data.	

Sample Type	Frequency	Acceptable Limits	Corrective Action	Analytical SOP
Laboratory Duplicate <sup>1</sup> Matrix Spike Duplicate	1 per 20 samples minimum 1 per batch	RPD ≤ 25	Determine cause, take appropriate corrective action. Recalibrate and reanalyze all suspect samples or flag all suspect data.	
Surrogates	Every sample	70-130%	Determine cause, take appropriate corrective action. Recalibrate and reanalyze all suspect samples or flag all suspect data.	

**Aquatic Toxicity**

Lab Control Sample, <i>Ceriodaphnia dubia</i>	1 per 20 samples, minimum 1 per batch	≥80% mean survival; 60% of the surviving control females must produce 3 broods with an average of 15 or more young per female; all performance criteria outlined in SOP are met.	Determine cause, take appropriate corrective action. Reanalyze all suspect data.	Appendix III – Chronic S. capricornutum Growth, Chronic C. dubia Survival and Reproduction, Chronic P. promelas Survival and Growth, Acute H. azteca Survival, Chronic C. dilutus Survival and Growth
Lab Control Sample, <i>Chironomus dilutus</i>	1 per 20 samples, minimum 1 per batch	≥80% mean survival; an average of ≥0.60 mg ash-free dry weight for surviving individuals; all performance criteria outlined in SOP are met.	Determine cause, take appropriate corrective action. Reanalyze all suspect data.	
Lab Control Sample, <i>Hyalella azteca</i>	1 per 20 samples, minimum 1 per batch	≥90% mean survival in the controls; all performance criteria outlined in SOP are met.	Determine cause, take appropriate corrective action. Reanalyze all suspect data.	
Lab Control Sample, <i>Pimephales promelas</i>	1 per 20 samples, minimum 1 per batch	≥80% mean survival; an average of ≥0.25 mg dry weight for surviving individuals; all performance criteria outlined in SOP are met.	Determine cause, take appropriate corrective action. Reanalyze all suspect data.	

Sample Type	Frequency	Acceptable Limits	Corrective Action	Analytical SOP
Lab Control Sample, <i>Selenastrum capricornutum</i>	1 per 20 samples, minimum 1 per batch	≥ 200,000 cells/mL; variability of control replicates ≤ 20%; all performance criteria outlined in SOP are met.	Determine cause, take appropriate corrective action. Reanalyze all suspect data.	

<sup>1</sup>For the purposes of this project, it is acceptable for the matrix spike duplicate or the laboratory control spike duplicate to represent the lab duplicate as a measure of the precision of the analytical method. Both samples will be evaluated according to the laboratory duplicate MQO for precision provided here.

## Approval:

The amendment(s) detailed within this document has been conditionally approved by the Water Board signatories. By signing this amendment, all parties listed below acknowledge and accept these changes. A copy of this document shall be distributed to all parties within the QAPP distribution list and shall be included and/or attached to all distributed copies of the original QAPP.
